LAPTOPT → PROJECTOR

Step 1: Check the video ports on your laptop (HDMI, VGA, or USB-C).

Step 2: Plug the correct cable into your laptop. For example, plug the HDMI cable into the HDMI port on the laptop.

Step 3: Plug the other end of the cable into the projector's video input port.

Step 4: Connect the projector to a power outlet and turn it on.

Step 5: Use the projector remote control to select the correct input source (HDMI or VGA).

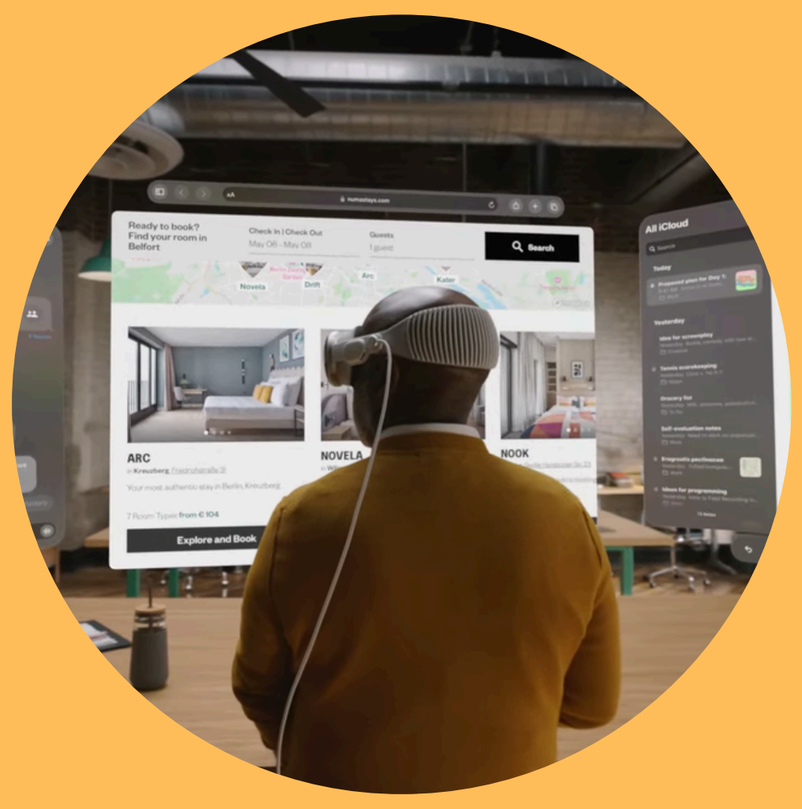
Step 6: Your laptop will automatically send the image to the projector.
If it does not, press Windows + P (on Windows) or go to Display Settings (on Mac) and choose "Duplicate" or "Extend" to transfer the screen to the projector.

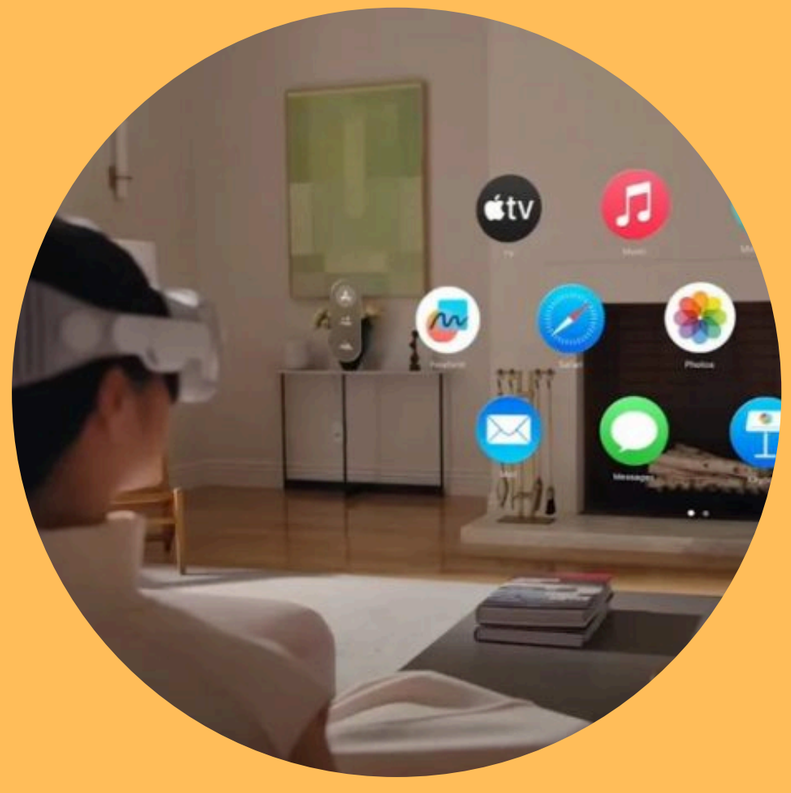
Step 7: Adjust the focus and position of the projector image if necessary.

Step 8: When you finish, disconnect the cable from the laptop and disconnect the projector from the power source.

VR HEADSET

A VR headset works by creating a virtual environment that you can see and interact with. First, you connect the headset to a computer, console, or smartphone. In some systems, you need to plug it into the device using a cable, while others work wirelessly

The controllers also connect to the system and send movement data to the device, allowing you to interact with objects in the virtual world. When you finish using it, you should disconnect the headset from the device properly.




The device sends images to small screens inside the headset. These images are displayed very close to your eyes to create a 3D effect. At the same time, sensors inside the headset track your head movements and transfer the data to the computer. The system processes this information and sends updated the content back to the headset so the virtual world moves when you turn your head.
